ORDINARY, SUPERFICIAL WOUNDS OR SKIN DEFECTS

Examples
- Skin injury after fall
- Skin defects as a result of a skin disease (stressed, dry, scaly, irritated skin)
- Superficial laceration
- Burn wound

Treatment
1. Cleanse the wound under running water or with physiological saline solution. One-time disinfection in case wound is heavily contaminated.
2. Spray directly onto the affected area.
3. Cover the wound with a plaster. Alternatively, cover the wound with a non-woven gauze that is held in place with an adhesive bandage.

Repeat the treatment every day.

NON-HEALING WOUNDS

Examples
- Ulcus cruris
- Pressure ulcer
- Diabetic ulcer
- Other non-healing wounds

Treatment
1. Clarify causes of wound and causal therapy (e.g. compression, pressure relief, re-vascularization).
2. Cleanse the wound under running water or with a physiological saline solution.
3. Debride wound if necessary.
4. Spray onto the wound and periwound skin.
5. Cover the wound with a non-woven gauze or absorber (adjusted to the wound exudate).
6. If the wound does not show any tendency to heal within 4-6 weeks, further steps towards clarifying the causes of the wound have to be initiated.

Repeat the treatment every day.
PALLIATIVE WOUND CARE

Introduction

Quality of life has priority over wound closure at any price. Important aspects are:

- Individually adapted pain therapy
- Enough time for the dressing change
- Prevention of smells
- Optimal exudate management

Treatment

1. Use pain medication if necessary.
2. Cleanse the wound under running water or with physiological saline solution.
3. Spray directly onto the affected area.
4. Cover the wound with a non-woven gauze or another secondary dressing that is ideal for the current situation.

Repeat the treatment as often as possible and as little as necessary.

HOW MANY SPRAY PUFFS?
